Section 1 Project Summary

Project Summary

Image 1 – Cable Dahmer Arena – East Entrance

Project Overview

The project entails the assessment of the existing conditions of the Cable Dahmer Arena at 19100 East Valley View Parkway in Independence, Missouri. The purpose of this study is to assist the Independence Events Center Community Improvement District Board in identifying immediate maintenance issues as well as to plan for potential future capital expenditures for the facility.

Project Scope of Work

The scope of work includes the visual observation and assessment of the concrete sidewalks adjacent to the building; the exterior envelope including the roof, windows, doors, and exterior wall surfaces; the mechanical, electrical, plumbing, and fire protection equipment; the ice plant and associated equipment; the food service equipment; and finally, load bank testing of the emergency generator. Based on the visual observations and assessment of the existing building conditions, recommendations are made for improvements to the various systems.

The project has been organized into the following phases:

Kick Off Meeting

- Discussion of project goals and objectives.
- Review of project workplan, schedule and deliverables.
- Discussion of on-site logistics.

Data Gathering

- Review of existing drawings, specifications, and previous construction submittals.
- Review of existing maintenance records and previous assessments.

On-Site Visual Assessment

- Assessment of concrete sidewalks and paving adjacent to building.
- Assessment of existing exterior envelope (includes roof, windows, doors, and exterior wall surfaces).
- Assessment of existing mechanical, electrical, plumbing, and fire protection equipment.
- Assessment of ice plant and associated equipment.
- Assessment of food service equipment (includes cooking, refrigeration, and beer equipment).
- Load bank testing for emergency generator.
- Discovery discussions with maintenance staff.

Cost Opinions and Draft Reporting

- Preparation of opinion of replacement costs.
- Preparation of opinion concerning remaining life expectancy of reviewed systems.
- Preparation of draft schedule of conceptual phasing of proposed work/replacement.
- Preparation of draft report narrative.

Review Meeting

- Review of draft cost opinion and report.
- Discussion of conceptual phasing schedule of proposed work/replacement.
- Discussion of phasing and implications of escalation.

Final Report

- Summary of assessment process.
- Narrative, including photos, describing results of visual assessment.
- Cost opinion in CSI format including assumptions and clarifications.
- Conceptual phasing schedule of proposed work/replacement.

Assessment Methodology

The assessment team reviewed relevant project information, including drawings and maintenance records. Various team members discussed existing conditions and priorities with building maintenance staff. The team performed on site survey of the various systems between December 2021 and January 2022. See individual sections for more detailed information on assessment methodologies.

Team Structure

The team is structured as outlined below. SFS Architecture corresponds directly with the City of Independence. Additional consultants have been contracted under SFS to assist with specialized aspects of the project.

Owner

Name	Organization	Project Role	Phone	Email
Morris Heide	City of Independence	Director of Parks/Recreation/Tourism		mheide@indepmo.org
Larry Hovick	Cable Dahmer	General Manager		larry.hovick@spectraxp.com
Larry White	Cable Dahmer	Maintenance Manager		larry.white@spectraxp.com

Design Team

Name	Organization	Project Role	Phone	Email
Kerry Newman	SFS Architecture	Principal	816.541.2255	knewman@sfsarch.com
Dana Gould	SFS Architecture	Project Manager	816.541.2286	dgould@sfsarch.com
Curt Elliott	JE Dunn Construction	Engineering Services Director	816.292.8641	curt.elliott@jedunn.com
Mark Adams	JE Dunn Construction	Engineering Services Manager	816.292.8685	mark.a.adams@jedunn.com
Chris Nieland	JE Dunn Construction	M/E Engineer 3	816.292.8622	chris.nieland@jedunn.com
Jim Tucker	JE Dunn Construction	M/E Engineer 3	816.426.8385	jim.tucker@jedunn.com
Mike Gerstner	RTI Consultants	Principal	913.649.6565	mike@rtic.com
Terry Anderson	TriMark Hockenbergs	Vice President	913.998.7568	terry.anderson@trimarkusa.com

Phasing Recommendations

The building is in good overall condition; however, it requires replacement of and repairs to the various building systems. A planned approach as outlined below will bring the facility up to current standards and set the building up to serve the City's needs for years to come.

The following rough order of magnitude (ROM) costs are in current dollar amounts and do <u>not</u> include escalation. Current escalation is approximately 3% per quarter and should be factored into future projects. Cost estimates do not include general contractor overhead, as it is assumed that vendors and subcontractors will be contracted directly with the City.

PHASE I (0-12 MONTHS)

Phase I repairs are recommended to be completed immediately. Work includes repair and replacement of the exterior concrete sidewalks, ramps and stairs; repairs to the roof; replacement of the exterior doors, frames and hardware; replacement of the non-functioning kitchen equipment and upgrades to the walkins; repairs to the mechanical, electrical and plumbing equipment; repairs to the ice plant and associated equipment; replacement of the arena seating; and replacement of the arena floor sealant.

The total cost for Phase I is \$4,073,279.

PHASE II (1-2 YEARS)

Phase II repairs are recommended to be completed in one to two years. Repairs include additional repairs to the mechanical equipment; replacement of the refrigeration and ice machine equipment; and upgrades to the beer system.

The total cost for Phase II is \$4,490,549.

PHASE III (2-5 YEARS)

Phase III repairs are recommended to be completed in two to five years. Repairs include repairs to the building envelope such as spot repointing of the brick veneer, replacement of the vertical sealant joints, painting of the stucco facades and overall façade cleaning; additional repairs to the mechanical, electrical and plumbing equipment; replacement of the cooking equipment; and replacement of the concessions warming equipment.

The total cost for Phase III is **\$1,241,887.**

Section 2

Existing Conditions and Recommendations

Site

Concrete Sidewalks Adjacent to Building

SFS Architecture performed a visual survey of the concrete adjacent to the building on December 14, 2021. The sidewalks, curbs, ramps, and stairs were reviewed for cracking, spalling, and deteriorated sealant joints. Observations were noted on enlarged site plan drawings which are included in Appendix A. Documented conditions include the following:

- 1. Spalling concrete at curb
- 2. Crack, ¹/₄" or greater
- 3. Crack, ¹/₄" or less
- 4. Spalling at expansion joints
- 5. Uneven joint greater than 1/2"
- 6. Failed sealant joint
- 7. Spalling at control joint
- 8. Spalling at bollard

The sidewalks are constructed of 4" thick concrete with full-depth and partial-depth control joints and fulldepth expansion joints. Curbs are also constructed of concrete in varying section profiles.

Existing Conditions

The concrete sidewalks, curbs, ramps, and stairs are approximately thirteen years old. The concrete exhibits spalling concrete at the curbs, expansion joints, control joints and bollards; cracking; uneven joints; and failed sealant joints. Reference the Appendix A for exact locations of deterioration.

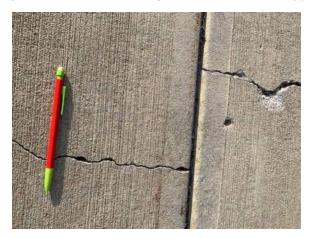

Image 2 – Typical cracking at sidewalks.

Image 3 - Failed sealant joint.

Image 4 – Spalling concrete at curb.

Image 5 – Spalling concrete at expansion joints.

Recommendations

The sidewalks, curbs, ramps, and stairs are in good general condition. With the following repairs, they should have a remaining service life of 15-20 years. Replace 100% of the sealant joints throughout the sidewalks and provide the following repairs. All new concrete shall match the existing concrete in mix design, color, and surface texture.

- 1. Spalled concrete at curb: Replace curb section. Match existing curb profiles.
- 2. Crack, 1/4" or greater: Replace sidewalk section, joint to joint.
- 3. Crack, ¼" or less: Replace sidewalk section, joint to joint.
- 4. Spalling at expansion joints: Sawcut, pour back, and install expansion joint along brick pavers.
- 5. Uneven joint greater than $\frac{1}{2}$ ": Replace sidewalk section on each side of joint and level.
- 6. Failed caulk joint: Replace 100%.
- 7. Spalling at control joint: Replace sidewalk section, joint to joint and install new control joint.
- 8. Spalling at bollard: Remove loose concrete and patch sections with greater than 2" diameter loss.
- 9. Spalling at stairs: Remove loose concrete and patch repair tread corners at stairs.
- 10. Spalling at dock curb: Remove loose concrete and patch repair dock curb.

Building Envelope

Roof

On January 11, 2022, RTI Consultants completed a visual roof review on the Cable-Dahmer Arena. The purpose of the review was to provide an opinion of the condition of all roof areas, identify needed repairs, and an opinion of remaining life expectancies of each roof area.

Photographic documentation of the findings and observations as well as a roof plan identifying roof areas "A" – "O" are included in Appendix B. Original construction drawings dated November 20, 2008, were provided for our review. No additional information about the existing roof system was provided.

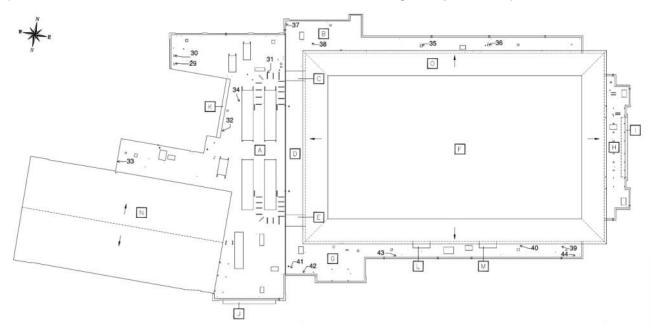

Figure 1 – Roof Plan Identifying Roof Areas (Not to Scale) – See Appendix B for enlarged plan.

The facility is constructed with fifteen separate roof areas. The roof system on thirteen of the roof areas is a single ply roof membrane (areas "A" – "M") consisting of approximately 84,562 square feet. Existing documentation provided to our office indicates the single ply roof membrane areas have the following components:

- +/- one ply 60 mil white EPDM (Ethylene Propylene Diene Terpolymer)
- +/- .25-inch gypsum composite cover board
- +/- 2.3-inch polyisocyanurate roof insulation (R14)
- +/- 1.0-inch polyisocyanurate roof insulation (R6)
- Metal roof deck

Roof area "N" is installed with an architectural metal panel consisting of approximately 24,427 square feet with an approximate 4:12 roof slope. No existing documentation was provided to our office for this roof area so the substrate and thickness of roof insulation below the metal roof panel is unknown.

Roof area "O" is installed with an asphalt laminated shingle consisting of approximately 34,016 square feet with an approximate 12:12 roof slope. Existing documentation provided to our office indicates this roof area is installed with the following components:

- Asphalt laminated composite shingle
- +/- one ply self-adhering underlayment
- +/- 3.7-inch Composite sheathing (OSB laminated to polyisocyanurate R20.4)
- Metal roof deck

Area	Sq. Ft.	Type of Roof System		
A	+/- 24,037	60 mil White EPDM		
В	+/- 6,857	60 mil White EPDM		
С	+/- 210	60 mil White EPDM		
D	+/- 2,850	60 mil White EPDM		
E	+/- 252	60 mil White EPDM		
F	+/- 39,202	60 mil White EPDM		
G	+/- 6,933	60 mil White EPDM		
Н	+/- 3,094	60 mil White EPDM		
I	+/- 410	60 mil White EPDM		
J	+/- 218	60 mil White EPDM		
К	+/- 247	60 mil White EPDM		
L	+/- 126	60 mil White EPDM		
М	+/- 126	60 mil White EPDM		
N	+/- 24,427	Architectural standing seam metal panel		
0	+/- 34,016	Asphalt laminated shingle		
TOTAL:	+/- 143,005			

The size and type of each roof system is identified in the table below.

Existing Conditions

The existing roof system on all areas is approximately thirteen years old. We have identified the following deficiencies on specific roof areas and have also identified the approximate location of each deficiency photo on the roof plan included with this report:

Area "A"

- 1. Deteriorated sealant on storm collars around two large flue pipes (photos 29, 30).
- 2. Open base flashing lap on roof curb flashing (photo 31).
- 3. Miscellaneous debris on roof surface (photos 32, 33).
- 4. Coating on roof membrane from previous repairs (photo 34).

Area "B"

- 1. Two exhaust fans are not attached to roof curb (photos 35, 36).
- 2. Water behind wall base flashing membrane (photo 37).
- 3. Coating on roof membrane from previous repairs (photo 38).

Area "G"

- 1. Roof insulation appears to have been "crushed" below walk pads adjacent to wall approximately 9' x 63' (photos 39, 40).
- 2. Debris on roof surface (photos 41, 42, 43, 44).

No roof deficiencies were noted on areas C, D, E, F, H, I, J, K, L, M, N.

Recommendations

In our opinion, the existing low slope roof areas ("A" – "M") are in good condition, need minor maintenance/repairs, and have a remaining service life of 10-12 years. In our opinion, the existing steep slope architectural metal roof system ("N") is in good condition and has an estimated remaining service life of 20-25 years. In our opinion, the existing steep slope asphalt shingles (area "O") are in good condition and have an estimated remaining service life of 10-12 years.

At this time, we recommend repairs to all noted deficiencies including the removal of suspected damaged roof insulation on area "G".

An estimated cost for removal of noted debris and repairs to all items noted except for replacing damaged roof insulation on roof area "G" is \$4,600.00. In our opinion, removal of damaged roof insulation on area "G" should consist of the following scope of work:

- 1. Remove roof system to metal roof deck in an area approximately 9' x 63'
- 2. Mechanically attach new polyisocyanurate roof insulation to metal roof deck matching existing insulation thickness.
- 3. Adhere new 0.5-inch gypsum composite cover board insulation to polyisocyanurate roof insulation with foam adhesive.
- 4. Fully adhere one ply 60 mill EPDM membrane to cover board roof insulation.
- 5. Install new rubber walk pads provided by roof membrane manufacturer.

In our opinion, an estimated cost for the replacement of the damaged roof insulation on roof area "G" as described above is approximately \$24,750.00.

The roof condition described in this report represent conditions that existed at the time the roof evaluation was performed. To achieve the maximum life expectancy of this roof system, we recommend the performance of an annual roof evaluation to identify conditions that can shorten the life expectancy.

Windows and Doors

SFS Architecture performed a visual survey of the windows and doors on December 14, 2021, and January 18, 2022. The windows and doors were reviewed for cracked glass, broken seals, missing or displaced gasketing, and deteriorated finish. Observations were made from grade via binoculars and upclose from the interior of the building where accessible. Select doors were opened where unlocked to check door operability. Building maintenance staff provided further information regarding the condition of the doors. Observations were hand noted on elevation drawings which are included in Appendix A.

The windows and main entrance doors are constructed primarily of aluminum storefront frames with a dark bronze finish and 1" clear low-E insulated glass. One-inch-thick insulated spandrel panels conceal the second-floor structure at the large arched entrances. The loading dock man doors are constructed of painted flush metal doors with painted 2" hollow metal frames. The loading dock overhead doors are constructed of pre-finished steel coiling doors with steel angle guides. Backer rod and sealant seal the joints between the window and door frames and the opening material (CMU, precast concrete panel, brick veneer, and stucco).

Existing Conditions

The aluminum storefront windows and doors are approximately thirteen years old. The aluminum storefront systems exhibit no visible cracked glass and broken seals, and no missing or displaced gasketing. The bronze aluminum frames exhibit minor color fading typical of a building of this age. Some scuff marks were visible on the window frames. The aluminum doors that were tested were in good working condition; however, bi-annual maintenance is required to keep the doors in operable condition. The southeast entrance is settling requiring constant maintenance and grinding down of the frames.

The hollow metal doors and frames at the west loading dock elevation and Community Ice Building are also approximately thirteen years old. The doors and frames exhibit paint degradation and heavy rusting of the frames at the bottom six inches, likely due to the use of salts at the sidewalks during the winter months.

The sealant joints around the doors and window frames are dry, cracked and crazed.

Recommendations

In our opinion, the aluminum storefront windows are in good condition, and have a remaining service life of 17-27 years with the maintenance or replacement of individual components such as gasketing and glass on an as needed basis. The aluminum doors require constant maintenance and the City's preference is to replace them. The hollow metal doors and frames are in fair condition, and the City's preference is to replace them. All sealants are near the end of their useful life.

Replace 100% of the backer rod and sealant joints around all window and door frames. Replace ten (10) single and nine (9) pair of hollow metal doors and frames with new FRP doors in aluminum frames. Replace all existing aluminum doors and thresholds with new aluminum doors and hardware to include full-length hinges.

Image 6 – Typical aluminum-framed windows.

Image 8 – Discoloration at base of doors.

Image 10 – Deteriorated sealant joint.

Image 7 – Interior detail of aluminum-framed windows.

Image 9 – Rusting at base of metal frames.

Exterior Wall Surfaces

SFS Architecture performed a visual survey of the exterior wall surfaces on December 14, 2021, and January 18, 2022. The wall surfaces were reviewed for cracking, spalling, and staining. Observations were noted on enlarged elevation drawings which are included in Appendix A. Documented conditions include the following:

- 1. Rust staining
- 2. Cracking
- 3. Biological / atmospheric staining
- 4. Previous patch repairs
- 5. Efflorescence (white staining)

The exterior wall surfaces are composed of 13" thick precast concrete sandwich wall panels (with integral rigid insulation covered with aluminum frame); thin brick veneer in a running bond pattern with buff-colored mortar; integral buff-color stucco walls and soffits at the upper bowl; and prefabricated metal parapet caps, gutters and downspouts (see roofing section for caps, gutters and downspouts).

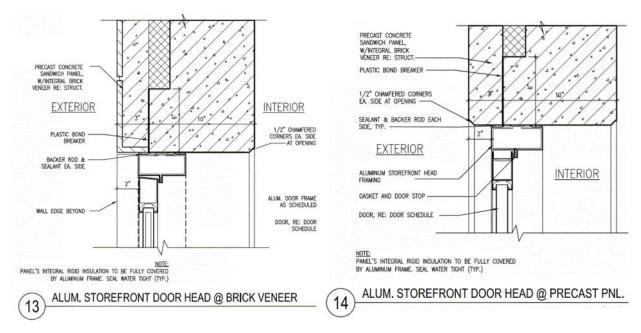

Image 11 and Image 12 – Typical wall details showing precast panels and brick veneer assembly at aluminum storefront door heads (11/20/08 Construction Set).

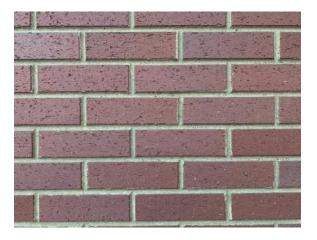

Image 13 – Typical running bond brick veneer.

Image 14 – Hairline cracking in precast panel.

Image 15 – Precast concrete panels with rust staining.

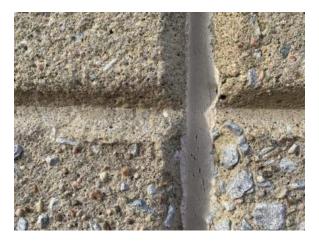

Image 16 - Deteriorated sealant at expansion joint.

Image 18 – Biological staining adjacent to leader.

Image 17 – White surface film on veneer brick.

Image 19 – Hairline cracking in stucco.

Existing Conditions

The exterior wall surfaces are approximately thirteen years old. Biological growth and atmospheric staining were observed on all wall surfaces in building corners and on facades that do not receive adequate sunlight to fully dry the surfaces. This type of staining was also prevalent at areas adjacent to open seams in the parapet caps, gutters, and downspouts, and below windowsills.

The concrete wall panels are in good condition. Rust staining was observed throughout the facades. The rust staining is possibly due to iron deposits within the original concrete wall panel mix. These areas do not appear to be causing imminent damage to the concrete walls. Hairline cracking was also observed throughout the concrete wall panels. These areas hold water but do not appear to be causing imminent damage to the concrete or panel displacement observed.

The thin brick veneer is also in good condition. There are areas of white efflorescence staining and areas with a white film on the brick. Some recent repointing campaigns do not match the original mortar color. There are minor areas of damaged and cracked brick.

The stucco exhibits several vertical hairline cracks throughout all facades.

Recommendations

The exterior wall surfaces are in good condition. With the following repairs, they should have a remaining service life of 20-35 years. Repair the caps, gutters, and downspouts per the roofing section of this report prior to making repairs to the exterior wall surfaces. All parapet cap, gutter, and downspout seams shall be made watertight. Clean the biological growth, atmospheric staining and efflorescence using the least invasive means of cleaning as possible. Repoint open mortar joints and replace non-matching mortar joints with new mortar matching the color of the original mortar color. Repaint 100% of the stucco with a paint formulated for stucco substrates. Monitor hairline cracks in the concrete wall panels for increase in size and spalling concrete adjacent to the cracks.

Mechanical, Electrical, Plumbing and Fire Protection

Mechanical

System Description The majority of the Main Arena and Community Ice Rink are conditioned by multiple packaged rooftop units that are equipped with direct expansion cooling coils and natural gas fired burners. Various terminal units located throughout the facilities supplement the rooftop units and provide conditioning to smaller spaces. There are various exhaust fans that serve kitchens, restrooms, mechanical/electrical rooms, and other general exhaust needs. Two natural gas fired boilers provide heating hot water to the hot water terminal units. The mechanical equipment is controlled by a Siemens building automation system (BAS). Additional details about this equipment can be found in the Existing Conditions section below.

Assessment Methodology / Process Our team completed a visual inspection of the existing mechanical system. We inspected the major equipment and a portion of the terminal units where accessible. We also interviewed the facilities staff while on site to get a better understanding of the existing conditions.

Existing Conditions

Rooftop Units All of the rooftop units (RTUs) were visually inspected, and the results of the inspection are shown in Appendix C. Most of the access panels required special tools to open, and all interior components could not be fully inspected. However, exterior inspections were able to be provided on all units and limited interior inspections on the larger units. In general, the following conditions were found:

 Burner Condensate Leakage: There were signs of condensate leakage from the natural gas burners. The picture below shows one of the larger RTU burners that has leaked, and the leaks have been sealed with the red caulking shown. However, caulking the leaks is a temporary fix that will continue to have to be monitored and maintained. Over time, the corrosive condensate will continue to make these leaks worse resulting in combustion gases from the burner making their way into the air stream instead of the flue.

Image 20 – One of the larger RTUs that has leaked.

• Damaged Condenser Coils: The majority of the condenser coils on the RTUs were found to be damaged by the weather (i.e. hail) and dirty. The damage to the coil fins and the dirt/debris limits the condensers' ability to remove heat from the refrigeration circuit resulting in a less efficient cooling system and longer run times for the compressors and fans shortening their service life.

Other Issues: Below are issues that were found for specific RTUs from the inspection and conversations with the facilities staff and maintenance personnel.

27

- RTU-24-4: This unit serves the Community Ice Rink and the maintenance technician indicated this unit seems to operate nonstop which may be a sign it is undersized.
- RTU-31-1 & RTU-33-1: The facilities staff feels these units are undersized since they have to close the outside air dampers in the summer months in order to provide enough cooling.
- RTU-33-2 & RTU-33-3: The facilities staff said that these units should be flip-flopped. They believe RTU-33-2 is undersized and RTU-33-3 is oversized.
- RTU-25-3: The bird/hail screen for the condenser coil has fasteners that have been disconnected from the unit limiting the protection of the coil (see picture below).

<u>Remaining Life</u>: The ASHRAE Handbook – HVAC Applications show a Median Service life of 15 years for Rooftop Air Conditioners. However, factors such as exposure to extreme weather (i.e. - hail, wind, temperature changes), run times, etc. can decrease the Median Service life. The RTUs are approximately 13 years old and are very close to or at the end of their Service Lives based on their age and condition.

Air Conditioning Units All of the condensers for the air conditioning units were visually inspected, and the results of the inspection are shown in Appendix C. The evaporator coils and supply fans are in an enclosure within the ceiling space and were not inspected. In general, the following conditions were found:

 Damaged Condenser Coils: The majority of the condenser coils for the air conditioning units were found to be damaged by the weather (i.e. hail) and dirty. The damage to the coil fins and the dirt/debris limits the condensers' ability to remove heat from the refrigeration circuit resulting in a less efficient cooling system and longer run times for the compressors and fans shortening their Service life.

• Deteriorating Base Supports: The 4"x4" wood base supports for condensing units CU-31-2 and CU-32-2 were found to be significantly deteriorated. This deterioration keeps the conditioning unit from being level. Multiple issues can occur if the condenser is not level. These issues include damage to the fan motor, trapped oil/refrigerant, excess vibration, etc. that all result in shortening the life of the air conditioning unit.

 R-22 Refrigerant: The U.S. Government issued a requirement that R-22 refrigerants must be eliminated from use in all new cooling systems by 2020. R-22 refrigerant can no longer be manufactured either. This ban allows existing equipment utilizing R-22 refrigerant to remain but, the supply of R-22 is very limited since it is no longer manufactured. This results in costly repairs and charging of the any existing equipment using R-22 refrigerant. There are multiple air conditioning units that utilize R-22 refrigerant as their cooling medium.

• Refrigerant Piping Insulation: The exterior refrigerant piping insulation coating/paint has begun to flake off exposing the insulation to the sunlight (UV rays) and weather. This exposure has resulted in deterioration of the insulation that will continue to increase over time.

• Controls: The facilities staff indicated the Liebert air conditioning unit controllers no longer work. The facilities staff must manually monitor the space temperature and thermostats.

<u>Remaining Life</u>: The ASHRAE Handbook – HVAC Applications show a Median Service life of 15 years for Air Conditioners. However, factors such as exposure to extreme weather (i.e. - hail, wind, temperature changes), run times, etc. can decrease the Median Service life. The Air Conditioners are approximately 13 years old and are very close to or at the end of their Service Lives based on their age and condition.

Exhaust Fans All of the rooftop exhaust fans were visually inspected, and the results of the inspection are shown in Appendix C. In most cases, the damper and fan/motor could not be accessed. The inline fans serving the Telecom Rooms and the Bowl Relief Smoke Exhaust Fans were not inspected in detail. In general, the following conditions were found:

 Grease & Debris Build Up: EF-21-1 that serves the Commissary Kitchen Exhaust Hood was found to have grease built up on its fan blades. EF-21-2 that serves the Commissary Dishwasher Exhaust was found to have debris in the fan that may have come from hard water/minerals/chemicals in the dishwasher exhaust stream. EF-32-2 that serves the Grille Exhaust Hood Event Level had grease build up in the fan housing because the grease drain looked to be clogged.

CABLE DAHMER ARENA FACILITY ASSESSMENT - FEBRUARY 2022

• Missing Fasteners: Some of the fasteners for the fan's housing and curb were found to be missing on EF-21-3, EF-21-4, EF-25-1, EF-32-3, and EF-33-2.

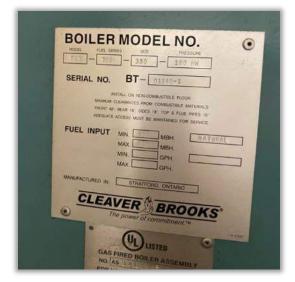

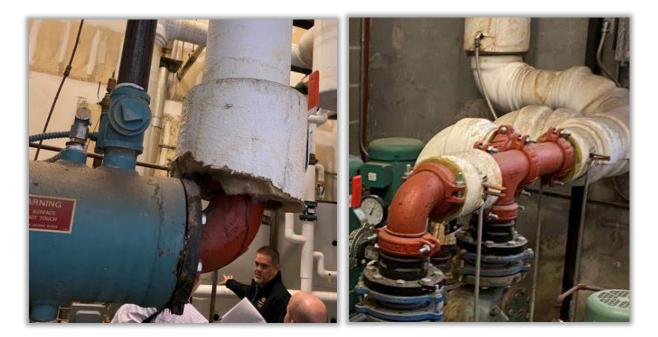

<u>Remaining Life</u>: The ASHRAE Handbook – HVAC Applications show a Median Service life of 20 years for Fans Ventilating Roof-Mounted. However, factors such as exposure to extreme weather (i.e. - hail, wind, temperature changes), run times, etc. can decrease the Median Service life. The Exhaust Fans are approximately 13 years old and still have 5-10 years of useful life left based on their age and condition.

Heating Hot Water System Two natural gas fired, forced draft boilers provide heating hot water to unit heaters and air curtains located throughout the building. The boilers are original and seemed to be in good working condition, visually/physically. The two boiler circulation pumps and two building circulation pumps were found to be in fair condition, some visual deterioration but generally in good working condition. The facilities staff indicated they have to maintain a heating hot water supply temperature of 120F year-round in order to keep the grooved mechanical fittings from leaking. Additionally, insulation on some of the pipe fittings has been removed.

The sealant on one of the boiler flues has deteriorated over time, allowing rainwater to run down the exterior of the flue causing it to rust.

<u>Remaining Life</u>: The ASHRAE Handbook – HVAC Applications show a Median Service life of 25 years for Boilers Hot-Water and 10 years for Pumps Pipe-Mounted and 20 years for Pumps Base-Mounted. Since the pumps are pipe-mounted but supported by the floor, the Median Service life is approximately 15 years. The boilers and pumps are approximately 13 years old, leaving approximately 10-15 years of useful life for the boilers and 5 years for the pumps.

Terminal Units There are various terminal units located throughout the building that serve smaller spaces or provide perimeter heating to larger spaces.

Hot water unit heaters and cabinet unit heaters provide heating to the mechanical rooms, loading dock, stairwells and vestibule. Visual inspection of the heaters did not reveal any issues and appeared to be in good working condition. The coils of the unit

heaters in the boiler room had some dust/debris on them that can easily be cleaned off.

Hot water air curtains provide heating whenever the loading dock doors are opened. Visual inspection of the heaters did not reveal any issues and appeared to be in good working condition.

Natural gas fired, radiant heaters provide perimeter heating to the Community Ice Rink. Visual inspection of the heaters did not reveal any issues and appeared to be in good working condition. However, one of the heaters did have a flue pipe disconnected that needs to be repaired.

<u>Remaining Life</u>: The ASHRAE Handbook – HVAC Applications show a Median Service life of 20 years for Unit Heaters Hot-Water and 18 years for Furnaces Gas (i.e. radiant heaters). The unit heaters/air curtains and radiant heaters are approximately 13 years old, leaving approximately 5-10 years of useful life for the unit heaters/air curtains and 5 years for the radiant heaters.

Recommendations

M1: Phased Replacement of All RTUs ASHRAE published data for equipment expected lifespan is 15 years for RTUs. All this equipment is nearing the end of its expected lifespan. Phased replacement is recommended per the Replacement Priority shown in Appendix C. "L" is Low Priority; "M" is Medium Priority and "H" is High Priority. This would renew equipment reliability for the arena and create energy savings. Replacement priority based on input from owner considering maintenance/repair history, and energy efficiency.

M2: Replacement of RTU-24-4 Serving the Community Ice Rink RTU is said to be undersized and runs continuously at full load during peak times to try to maintain low humidity levels within the space. Replacement which will net some good energy savings.

M3: Reconfirm Cooling Loads for RTUs 31-1, 33-1, 33-2 & 33-3 The facilities staff feels RTUs 31-1, 33-1, and 33-2 are undersized based on their current operation – i.e. RTU 31-1 and 33-1 outside dampers have to be closed in the summer months in order to provide enough cooling. The staff also feels RTU-33-3 is oversized. This recommendation includes re-evaluating the current loads and confirming the current is correctly sized to accommodate these loads. RTUs will need to be replaced if cooling loads don't match equipment sizes.

M4: Reconnect RTU-25-3 Condenser Coil Bird/Hail Screen The bird/hail screen protecting the RTU-25-3 condenser coil was found to be disconnected to some of its fasteners exposing a portion of the coil to the elements. This item includes reconnecting the screen to the unit.

M5: Comb Air Conditioning Unit Condenser Coils The air conditioning condenser coils were found to be in better condition than the RTU condenser coils. Therefore, simply having the coils combed in lieu of a full replacement will help the coil reject heat from the refrigeration circuit and improve the operation of the air conditioning system.

M6: Replace Air Conditioner Base Support Replace the 4"x4" wood supports with a rubber mounting base kit, or similar material, that won't deteriorate over time. This will ensure the unit remains level over its lifespan.

M7: Replace R-22 Refrigerant Air Conditioning Systems Replace each of the air conditioners that are currently using R-22 refrigerant with units that use a refrigerant that is approved by the U.S. Government and is readily available.

M8: Install Exterior Refrigeration Pipe Insulation Coating Reapply the weather barrier mastic on the exterior refrigeration pipe surfaces. Another more costly option would be to install an aluminum jacket on the pipe insulation, eliminating the need to maintain the weather barrier mastic. This recommendation also includes replacing any of the insulation that has been damaged due to its exposure to the elements.

M9: Replace Liebert Air Conditioning Unit Controls Replace the Liebert air conditioning unit controllers so the facilities does not have to manually monitor the temperatures of the spaces these units serve.

M10: Phased Replacement of All Air Conditioning Units ASHRAE published data for equipment expected lifespan is 15 years for Air Conditioners. All this equipment is nearing the end of its expected lifespan. Phased replacement is recommended per the Replacement Priority shown in Appendix C. "L" is Low Priority; "M" is Medium Priority and "H" is High Priority. This would renew equipment reliability for the arena and create energy savings. Replacement priority based on input from owner considering maintenance/repair history, and energy efficiency.

M11: Remove Grease & Debris From Exhaust Fans This recommendation includes removing the grease from the fan blades, fan housing and grease drain of exhaust fans EF-21-1 and EF-32-2. It also includes removing the debris from EF-21-2.

M12: Replace Missing Fasteners on Exhaust Fans Replace all fan housing and roof curb fasteners found to missing on exhaust fans EF-21-3, EF-21-4, EF-25-1, EF-32-3, and EF-33-2.

M13: Evaluate/Repair Grooved End Pipe Fittings This recommendation includes evaluating and investigating why the heating hot water system's grooved end pipe fittings leak whenever the water temperature falls below 120F. Fixing this will result in natural gas utility savings since the boilers won't have to be operated in the summertime to maintain the 120F water temperature.

M14: Install Insulation on Hot Water Pipe Fittings It appears the insulation was removed from the hot water pipe fittings in order to investigate the grooved end fittings that have been leaking. This item includes re-installing pipe insulation on the fittings where it has been removed. Installing the insulation will result in heating energy cost savings. This recommendation should only be implemented if recommendation M12 is completed.

M15: Reconnect Radiant Heater Flue Pipe This recommendation includes reconnecting the disconnected flue pipe. The flue pipe looked to be in good condition and will be reused to the greatest extent possible.

M16: Pursue Utility Rebates Independence Power & Light (IPL) offers up to \$20,000 per year for qualifying new construction or retrofit of HVAC equipment. This recommendation includes pursuing possible rebates and phase equipment upgrades over a certain time period to help break up the cost as well as qualify for rebates during consecutive years.

Electrical

System Description The facility electrical supply is fed by (2) utility transformers located in the service yard north of the community ice center. Power is transformed to 480/277V and feeds (2) main circuit breakers in the service entrance electrical gear labeled MSB1-1 and MSB1-2. From the main switchboard power is distributed throughout the facility utilizing a network of high voltage panels (480/277V), transformers and low voltage panels (208/120V). Emergency distribution is provided by a single emergency standby diesel generator through a generator distribution panel. Additional details about this equipment can be found in the Existing Conditions section below.

Assessment Methodology / Process Our team completed a visual inspection of the existing Electrical systems. We inspected the major distribution equipment and emergency generator system. We also interviewed the facilities staff while on site to get a better understanding of the existing conditions.

Existing Conditions

Normal Power Distribution The main electrical switchboards are located within a dedicated space adjacent to the utility service yard. Each main breaker is rated for 4000A at the service voltage. MSB1-1 feeds the larger process loads (mechanical roof top units and ice systems) and MSB1-2 feeds the lighting, receptacles and smaller mechanical loads throughout the facility. Distribution of the electrical equipment is separated into four quadrants on the concourse level around the perimeter of the main arena.

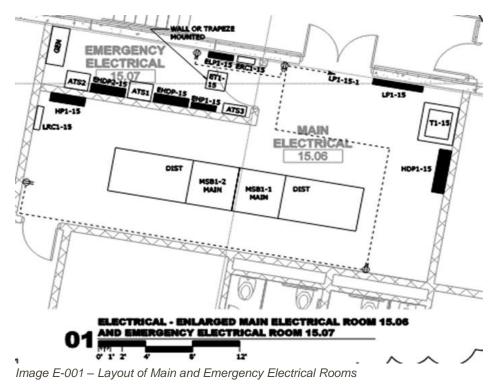

Image E-002 (left): MSB1-1 with single distribution section Image E-003 (right): MSB1-1 Main Circuit Breaker

Image E-004 (left): MSB1-2 with (2) distribution sections

Image E-005 (right): MSB1-2 Main Circuit Breaker

Remaining Life: Overall, the main electrical gear, associated distribution panels and transformers are in good condition. At approximately 13 years of service life, the equipment is halfway through the life expectancy of 25-30 years under normal operating conditions.

Emergency Power Distribution A single emergency generator is located within the service yard adjacent to the Emergency Electrical Room and feeds a single generator distribution panel GDP. The generator, Kohler Model No: 500REOZVB, has a diesel belly tank and is housed in an acoustical enclosure. The GDP is rated for 800A at 480/277A and feeds (3) automatic transfer switches and a single manual transfer switch for the ice chiller plant. Automatic transfer switch ATS-1 is rated for 600A, ATS-2 for 600A and ATS-3 for 100A. Manual transfer switch MTS-1 is rated for 400A.

Image E-006 (left): Emergency Generator in service yard. Image E-007 (right): Emergency Generator air intake opening.

Image E-008 (left): Generator Distribution Board-GDP with (4) breakers for transfer switches Image E-009 (right): Automatic Transfer Switches: ATS-1 and ATS-2

Image E-010 (left): Automatic Transfer Switch: ATS-3 Image E-011 (right): Manual Transfer Switch: MTS-1

<u>Remaining Life</u>: Overall, the emergency generator and transfer devices are in good condition. The exterior housing of the generator is starting to show some wear from the exterior elements. At approximately 13 years of service life, the equipment is halfway through the life expectancy of 25-30 years under standby operating conditions. According to facility management, the generator is started weekly and runs for an hour for general maintenance. As part of this facility assessment, the generator was put under a 4-hour load bank test to raise the generator set up to operating temperatures and capacity. The results of the testing are shown in Appendix D. The generator was found to be in good working order and passed test requirements.

Lighting Systems Lighting control is achieved through relay panels and localized control at individual areas. In general, the lighting systems have gone through some retrofit and replacement since the facility has been constructed and occupied. Overall, the lighting is in fair to good condition and routine maintenance is all that is required at this time.

Arenas: The main arena and the community ice arena have been fully converted from the original Metal Halide and Compact Fluorescent fixtures to LED based lighting systems within the past few years. All conversions have been successfully installed and are functioning as desired.

Public Areas: The majority of the lighting fixtures in the public areas are comprised of compact fluorescent downlights. As lamps fail at each individual fixture, they have been converted to a retrofit LED A-lamp solution.

Back of House Areas: The majority of the lighting fixtures in the back of house areas are comprised of compact fluorescent downlights and linear fluorescent troffers. As lamps fail at each individual downlight fixture, they have been converted to a retrofit LED A-lamp solution.

Exterior: The parking lighting has been converted from the original HID fixtures to an LED pole solution. LED Façade lighting has been added at the roof level for aesthetic purposes.

Lightning Protection System

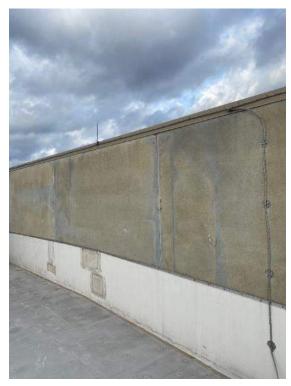

Image E-012 (left): Lightning Protection Air Terminal and Downlead Image E-013 (right): Lightning Protection Downlead and Thru-Roof Connection

Image E-014 (left): Lightning Protection conductor free from Roof Cable Holder

Image E-015 (right): Lightning Protection conductor free from Roof Cable Holder at Exhaust Fan

<u>Remaining Life</u>: Overall, the lightning protection system is in fair condition. The system is starting to show some wear from the exterior elements. At approximately 13 years of service life, the equipment is halfway through the life expectancy of 25-30 years under normal operating conditions.

Recommendations

E1: Continued Conversion of Lighting Source to LED As compact fluorescent sources reach end of life, LED lamping is recommended to be retrofit into existing fixtures. The conversion will not only create continuity but result in energy savings over the life of the system.

E2: Replace Batteries in Generator As part of the completed load bank test on the generator it was discovered that the current batteries are over (5) years old. The manufacturer recommends replacing the batteries every (2) years. Included in the generator load bank test report is a cost associated for the replacement batteries to be furnished and installed.

E3: Schedule Inspection of Lightning Protection System It is recommended that lightning protection systems be visually inspected yearly for loose connections, damage from events and weather corrosion. As shown in images E-014 and E-015 there are connections that have come free from the cable holders. Additionally, in-depth inspections shall be completed every 3-5 years to ensure compliance with the most current edition of NFPA 780.

Plumbing

System Description There are many spaces throughout the Main Arena and Community Ice Rink that have plumbing fixtures/service. The spaces include restrooms, locker rooms, kitchens, concession stands and suites. There is a domestic hot water heating system in the boiler room of the Main Arena and a domestic hot water system in the ice chiller room of the Community Ice Rink.

Assessment Methodology / Process Our team completed a visual inspection of the plumbing fixtures and associated piping that wasn't concealed. Additionally, we completed a visual inspection of the domestic water heaters and associated pumps and piping.

Existing Conditions

Plumbing Fixtures

 Restrooms and Locker Rooms: The plumbing fixtures in the restrooms and locker rooms include lavatories, water closets, urinals, and showers (for locker rooms). The lavatories are wallmounted and equipped with 2.2 gallon per minute (GPM) manual faucets. The water closets are wall-mounted and equipped with 1.6 gallons per flush (GPF) manual flush valves. The urinals are wall-mounted and equipped with 1.0 GPF manual flush valves. Visual inspection of these plumbing fixtures did not reveal any issues with them and they are appeared to be in good working condition.

Figure P-2

Figure P-3

Figure P-4

Figure P-5

 Kitchens and Concession Stands: The plumbing fixtures in the kitchens and concession stands include multiple compartment sinks and lavatories for hand washing. The concession stands also include countertop drain pans for the beverage taps that are piped directly to a floor drain. Each of the sinks and lavatories are equipped with 2.2 GPM manual faucets. Visual inspection of these plumbing fixtures did not reveal any issues and they appeared to be in good working condition.

Figure P-6

Figure P-7

Figure P-9

Figure P-8

• Suites: Each suite includes one beverage sink that is equipped with a 2.2 GPM manual faucet. Visual inspection of the sinks did not reveal any issues and they appeared to be in good working condition.

Figure P-10

<u>Remaining Life</u>: There is no published data on the lifespan of plumbing fixtures similar to the mechanical equipment in the ASHRAE Handbook. However, there are various estimates out there and on average the lifespan estimates of the different plumbing fixtures are listed below.

- Lavatories/Sinks: 50 Years
- Faucets: 15-20 Years
- Water Closets/Urinals: 50 Years
- Water Closet/Urinal Flush Valves: 6-7 Years

All of the plumbing fixtures are approximately 13 years old. Based on the lifespan estimates above, only the flush valves have exceeded their lifespan and will need to be replaced. Each of the flush valves tested seemed to work fine and we do not recommend replacement at this time. We only recommend replacing them with high efficient fixtures to save utility costs.

Domestic Hot Water Heating System The domestic hot water heating system in the boiler room of the Main Arena and a domestic hot water system in the ice chiller room of the Community Ice Rink were visually inspected. Visual inspection of the heaters did not reveal any issues with them and they appeared to be in good working condition.

Figure P-11

Figure P-12

<u>Remaining Life</u>: There is no published data on the lifespan of water heaters similar to the mechanical equipment in the ASHRAE Handbook. However, there are various estimates out there and on average the lifespan of a storage tank-type water heater is 8-12 years. Both water heaters are approximately 13 years old and have exceeded their estimated lifespan, however, we do not recommend replacing these heaters at this time since they were found to be in good condition.

Parking Lot Storm Drain System The facilities staff asked us to investigate the parking lot storm drain system outlets. The outlets discharge water over a bed of rip rap, or rock. Over time, the rip rap has eroded away resulting in significant erosion. The storm drain outlets that were inspected are bubbled in red in the drawing below. The following pictures show some of the erosion issues.

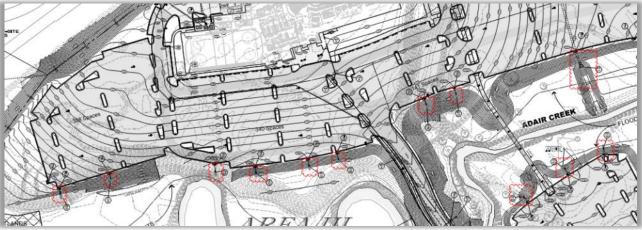

Figure P-13

Figure P-14

Figure P-15

Recommendations

P1: Replace Plumbing Fixtures with High Efficient Fixtures As stated above, the water consumption rates of the water closets are 1.6 GPF, the urinals are 1.0 GPF, and the sinks and lavatories are 2.2 GPM. This recommendation includes replacing the water closets with 1.0-1.28 GPF fixtures and flush valves, the urinals with 0.125 GPF fixtures and flush valves, the lavatory faucet aerators with 0.5 GPM aerators, and the sink faucet aerators with 1.5 GPM aerators. The implementation of this recommendation will result in water, sewer and domestic hot water heating usage savings.

P2: Repair Parking Lot Storm Drain Outlets This recommendation includes bringing in backfill to replace the soil that has been eroded. Additionally, more and larger rip rap will be installed to eliminate/limit any erosion in the future.

Fire Protection

System Description A 6" fire protection main water line enters the Water Entry Room located on the Northwest corner of the facility and provides water to the automatic sprinkler systems and fire hose supply system.

Assessment Methodology / Process Our team completed a visual inspection of the fire system components (i.e. sprinkler heads) and associated piping that were not concealed.

Existing Conditions

The fire protection system looked to be in good condition and the facilities staff did not make us aware of any issues.

Figure F-1

Figure F-2

Remaining Life: There is no published data on the lifespan of fire sprinkler systems similar to the mechanical equipment in the ASHRAE Handbook. However, there are various estimates out there and on average the lifespan of a fire sprinkler systems is 40-50 years. However, corrosion issues can shorten this lifespan to 15-25 years if air (oxygen) is introduced or trapped in the piping system. Our visual inspection did not reveal any apparent corrosion issues.

Recommendations

There are no recommendations at this time.

Ice Plant

Ice Plant and Associated Equipment

System Description The ice sheets for the Main Arena and Community Ice Rink are served by a watercooled chiller system that circulates a cold brine solution through a piping network under the ice sheets in order to keep the ice sheets frozen.

Assessment Methodology / Process Our team completed a visual inspection of the chiller system components and associated piping that wasn't concealed. We engaged Wagner-Meinert, an ice plant specialist, to perform a similar evaluation. One of Wagner-Meinhert's service leaders performed the inspection and his report can be found in Appendix E.

Existing Conditions

We found that the ice chiller is nearing the end of its normal life expectancy and piping is getting deteriorated and has a history of leaks that caused the need for emergency repairs. Some specific issues brought to our attention from the facilities staff include:

- 10" line has a leak.
- Compressor motors have to be replaced every three years, approximately.
- Brine solution has caused pipe corrosion issues over time.

The photos below and Wagner-Meinhert's report shows additional issues such as piping components that have significant rust/corrosion, pipe leaks, leaking cooling tower, etc.

Figure IP-1

Figure IP-2

Figure IP-3

Figure IP-4

Recommendations

IP1: Repairs/Upgrades to Existing Ice Chiller System We recommend implementing the items included in Wagner-Meinhert report located in the Appendix.

Kitchen Equipment

Trimark has broken the replacement needs of the equipment for budget purposes in the following phases in a detailed report found in the Appendix.

Phase 1. Replace Equipment that is currently not fully operational. This equipment needs to be replaced NOW. (Needs to be addressed Immediately)

Phase 2. Upgrade Existing Walk-in complexes, Doors sections and Refrigeration. (Recommend to address within the next 12 months)

Phase 3. Replace all ice machine heads and Refrigeration units. All systems are past expected life span. (Recommend to address within 12 to 24 months)

Phase 4. Beer System-Budget to have Beer system gone thru for performance check and upgrade system as needed. (Systems should be checked every 12 months minimum and cleaned frequently.)

Phase 5. Budget to replace all cooking equipment such as the fryers, ranges convection ovens they will all be past their expected life span. (Recommend to address 24 months or as failures happen as they have past there expected life span.

Phase 6. Concession/Warming Equipment -Budget to replace as they fail.

Below is a list of all equipment listed by area. All equipment on this list has exceeded the average life span of a commercial appliance and is recommended to be budgeted for replacement due to age, ware, and general overall condition. Some equipment below has more specific details pertaining to the condition. Units labeled "keg coolers" contain a direct draw beer dispensing system with a faucet on the counter above the coolers. Walk in panels have not exceeded their average life span and the general overall condition is fair; however, door sections and refrigeration need to be upgraded. The CSI tech noted that the walk ins and ice machines should be a priority over other equipment, followed by cooking and refrigeration equipment in the heavier traffic of higher volume areas

CABLE DAHMER ARENA FACILITY ASSESSMENT – FEBRUARY 2022

57	
21	

Section 3 Cost Estimate and Phasing Plan

Cost Estimate

Sidewalks, Ramps and Stairs	\$245,570
Roof	\$29,350
Windows and Doors	
Spot Repointing	\$10,000
Replace Sealant	\$30,000
Replace Doors, Frames and Hardware	*\$395,607
Exterior Wall Surfaces	
Paint Stucco Facades	\$19,000
Clean Building Facades	\$105,193
Mechanical, Electrical, Plumbing and Fire Protection	
Mechanical	\$6,642,300
Electrical	\$143,787
Plumbing	\$365,862
Fire Protection	\$0
Ice Plant and Associated Equipment	\$100,000
Arena Seating - Hussey Seating (Base Bid)	*\$956,000
Arena Joint Sealant Replacement – Kpoxy Construction	*\$29,744
Kitchen Equipment	\$733,302
TOTAL	\$9,805,715

*pricing provided by the City of Independence

Phasing Plan

PHASE I – 0-12 MONTHS

Sidewalks, Ramps and Stairs	\$245,570
Roof	\$29,350
Replace Doors, Frames and Hardware	\$395,607
Kitchen Equipment Phase 1 – Replace non-operational kitchen equipment.	\$173,559
Kitchen Equipment Phase 2 – Upgrade walk-ins.	\$97,500
Mechanical (all items except M1-M, M1-L, M10-M, & M10-L)	\$1,957,300
Electrical (E2 & E3)	\$2,787
Plumbing (P2)	\$85,862
Ice Plant and Associated Equipment	\$100,000
Arena Seating - Hussey Seating (Base Bid)	\$956,000
Arena Joint Sealant Replacement – Kpoxy Construction	\$29,744
TOTAL	\$4,073,279

PHASE II – 1-2 YEARS

Mechanical (M1-M & M10-M)	\$4,255,000
Kitchen Equipment Phase 3 – Replace refrigeration and ice machines.	\$170,167
Kitchen Equipment Phase 4 – Upgrade beer system.	\$65,382
TOTAL	\$4,490,549

PHASE III – 2-5 YEARS

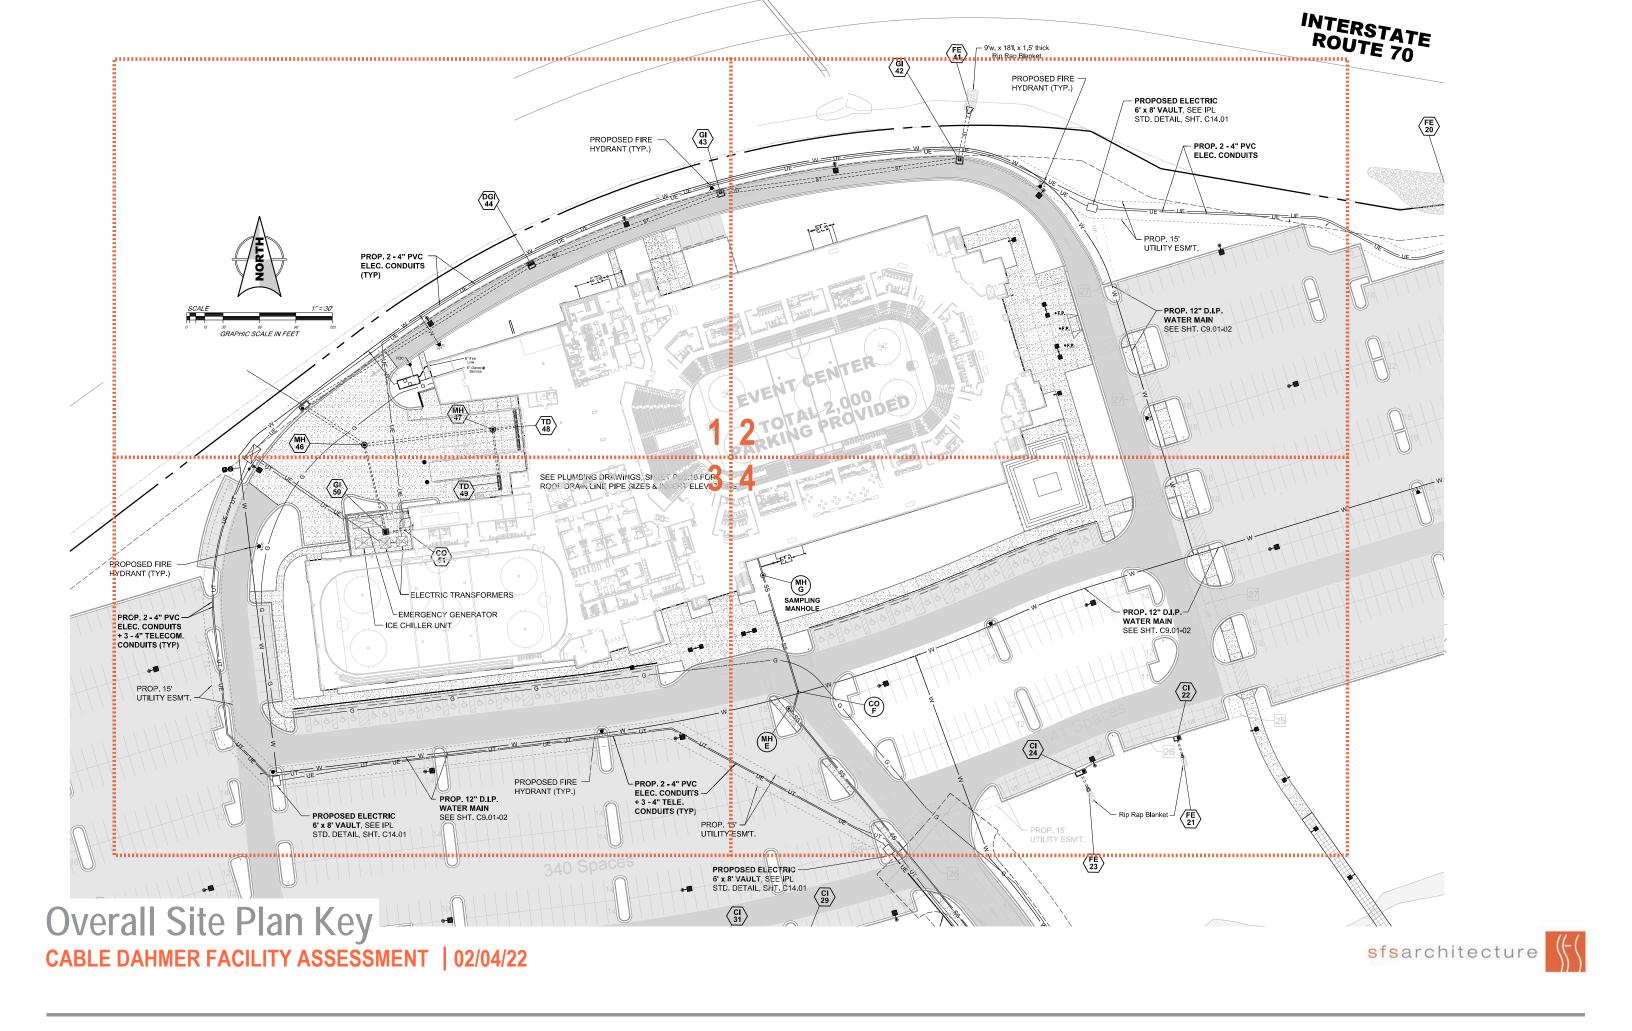

Spot Repointing	\$10,000
Replace Sealant	\$30,000
Paint Stucco Facades	\$19,000
Clean Building Facades	\$105,193
Mechanical (M1-L & M10-L)	\$430,000
Electrical (E1)	\$141,000
Plumbing (P1)	\$280,000
Kitchen Equipment Phase 5 – Replace cooking equipment.	\$120,083
Kitchen Equipment Phase 6 – Replace concession warming equipment.	\$106,611
TOTAL	\$1,241,887

Visual Inspection Condition Ratings

GOOD: Visually & physically in good working condition.

FAIR: Some visual deterioration but generally in good working condition

POOR: Significant problems - i.e. coil degradation, operation problems, etc. Equipment >10 years old & has had significant maintenance issues

Facility I	mprovement Options:	ROM Cost:	Notes:						
-		MECHANICAL							
M1-H	Phased Replacement of All RTUs - High Priority	\$1,100,000	Assumes Existing Ducwork & Electrical/NG Services Can be Reus						
M1-M	Phased Replacement of All RTUs - Medium Priority	\$4,200,000	Assumes Existing Ducwork & Electrical/NG Services Can be Reus						
M1-L	Phased Replacement of All RTUs - Low Priority	\$320,000	Assumes Existing Ducwork & Electrical/NG Services Can be Reus						
M2	Replacement of RTU-24-4 Serving the Community Ice Rink	\$380,000	Assumes Existing Ducwork & Electrical/NG Services Can be Reus						
M3	Reconfirm Cooling Loads for RTUs 31-1, 33-1, 33-2 & 33-3	TBD	An Engineer Would Need to be Hired to Reconfirm Cooling Load						
M4	Reconnect RTU-25-3 Condenser Coil Bird/Hail Screen	\$400	Includes Simply Reconnecting Screen to Unit						
M5	Comb Air Conditioning Unit Condenser Coils	\$3,600	Includes 2 Hour/Each of Labor to Comb Each of the (15) Conden						
M6	Replace Air Conditioner Base Support	\$15,100	Includes Replacing Base Supports on (15) Rooftop Condensing U						
M7	Replace R-22 Refrigerant Air Conditioning Systems	\$210,000	Assumes Refrigerant Piping Will be Reused						
M8	Install Exterior Refrigeration Pipe Insulation Coating	\$11,100	Includes Replacing Exterior Insulation & Applying New Coating of						
M9	Replace Liebert Air Conditioning Unit Controls	\$39,400	Includes Connecting (5) Liebert Units to Siemens BAS						
M10-H	Phased Replacement of All Air Conditioning Units - High Priority	\$210,000	Assumes Refrigerant Piping Will be Reused						
M10-M	Phased Replacement of All Air Conditioning Units - Medium Priority	\$55,000	Assumes Refrigerant Piping Will be Reused						
M10-L	Phased Replacement of All Air Conditioning Units - Low Priority	\$110,000	Assumes Refrigerant Piping Will be Reused						
M11	Remove Grease & Debris From Exhaust Fans	\$1,800	Includes Cleaning/Removing Grease on Fan Only - Fan/Compone						
M12	Replace Missing Fasteners on Exhaust Fans	\$700	Includes Fasteners for (5) Exhaust Fans						
M13	Evaluate/Repair Grooved End Pipe Fittings	TBD	Need to Evaluate Entire Piping System to Determine Scope						
M14	Install Insulation on Hot Water Pipe Fittings	\$3,700	Includes Boiler/Pump Fittings in Boiler Room Only						
M15	Reconnect Radiant Heater Flue Pipe	\$1,500	Includes Bringing in Scissor Lift to Access & Reconnect Flue Pipe						
M16	Pursue Utility Rebates	-\$20,000	IPL's Rebate Program Currently Offers Up to \$20,000 for Retrofi						
	ROM Cost - Mechanical:	\$6,642,300							
		ELECTRICAI							
E1	Continued Conversion of Lighting Source to LED	\$141,000	Replace Non-LED Lamps with LEDs. Assumed \$35/Fixt for Non-A						
E2	Replace Batteries in Generator	\$1,287	Quote From Faith Technologies						
E3	Schedule Inspection of Lightning Protection System	\$1,500	Includes (2) People for Single Day to Perform Inspection & Provi						
	ROM Cost - Electrical:	\$143,787							
		PLUMBING	ì						
P1	Replace Plumbing Fixtures with High Efficient Fixtures	\$280,000	Includes Replace Lavatory/Sink Aerators & Replacing Water Clos						
P2	Repair Parking Lot Storm Drain Outlets	\$85,862	Quote From Rodriquez Mechanical						
	ROM Cost - Plumbing:	\$365,862							
		ICE PLANT							
IP1	Clean Ice Plant Mechanical Room, Paint Pipe & Misc Equipment	\$10,000							
IP2	Perform NDT testing of supplya nd Return Brine Piping in chiller room	\$5,000	Not Destructive Pipe testing, Ultra Sonic test to determine defec						
IP3	Repalce Warm Floor Expansion Tank	\$9,500							
IP4	Install level tubes on existing expansion tank	\$3,500	Visual level of tank from the floor						
IP5	Investigate brine leak on Main rink (warm floor)	\$5,000							
IP6	Repalce missing pipe labels	\$2,000	Replace pipe labels that are missing						
IP7	Replace and re-insualte sock filter	\$5,500							
IP8	Replace Condensing Unit within the next 2-3 years	\$45,000	Repalce exisitng BAC Condensing Unit, will need to evaluate price						
IP9	Repair / Replace existing control valves	\$14,500							
	ROM Cost - Ice Plant:	\$100,000

Section 4	Appendix E: Wagner-Meinert
Section 4	Report

Curt,

It was a pleasure meeting you and going over my observations regarding our opinion on the Ice Plant at Cable Dehmer Arena. Our recommendations are as follows.

- Clean Room, Chiller Package and Paint Pipe and Chiller
- Perform NDT Testing on Supply and Return to Determine Integrity of Pipes
- Replace Warm Floor Expansion Tank
- Install Level Tubs on all Expansion Tanks so Level Can be Determined from Ground.
- Locate and repair Brine leak on Main Rink Warm Floor
- Replace Missing and Un legible Pipe labels
- Replace and Reinsulate Sock Filter
- Condenser will need to be Replaced with in the Next Few Years
- Recommend Control System be replaced, and Ice plant Control be Added to existing Building Control System Before Next Update is Needed.
- Recommend Regular Maintenance be Established ether Quarterly or Semi Annual

Feel free to reach out to me of you have any questions or concerns thank you.

Dan Mikes Service Leader Wagner-Meinert, LLC

Standard Contract Terms & Conditions

All quotations are subject to approval by the company. The above listed prices shall be firm for 30 days. Prices shown in this quotation are for specific items, quantities, and lead times indicated.

Prices are subject to change if all of the items are not ordered, if quantities ordered differ, or if adequate lead-time is not allowed.

The prices shown in this quotation DO/DO NOT include freight charges which will be added to our invoice. This quotation does not include any fees for local permits or licenses that may be required by your municipality or state.

The prices shown in this quotation DO/DO NOT include applicable taxes, which will be added to our invoice unless a valid certificate of exemption is provided by you. Please be advised that, under state law, some items may still be taxable. In states where TriMark Hockenbergs is not registered to collect Sales Tax, it is the buyer's responsibility to pay any applicable Use Tax due to the state.

Payment terms are 50% due at time of order, 45% due prior to delivery and 5% due based on customer terms. We impose a surcharge on credit cards that is not greater than our cost of acceptance. Please be advised that a 1.5% per month FINANCE CHARGE will begin to accrue upon expiration of the above payment terms. This will amount to 18% annually.

It is our understanding that you are requesting delivery of the items on this order during the week of {T.B.D.} if this date is not correct or is missing, please provide us with a scheduled delivery date ______. If an alternative date is not provided, the date specified above is considered confirmed. In the event that the delivery date is delayed by you, or any party other than TriMark Hockenbergs, for more than two (2) weeks from the agreed upon date, you hereby agree that TriMark Hockenbergs will bill you for "stored materials".

You also agree that any payments originally due "upon delivery" will become immediately due and payable. For valuable consideration, receipt of which is hereby acknowledged, you hereby grant to TriMark Hockenbergs a security interest in the equipment described herein and any and all additions and accessories thereto, to secure payment of the total debt and any and all other obligations to TriMark Hockenbergs under this agreement. The security interest created hereby shall terminate when obligations have been paid in full.

You hereby authorize TriMark Hockenbergs to file any UCC financing statement that it deems necessary to perfect its security interest.

On capital purchases, we require a perfected security interest in the goods until they have been paid for in full. TriMark Hockenbergs will handle all of the necessary U.C.C. filings and pay for any costs associated with these filings. Upon failure of you to promptly pay or perform any of the obligations or any covenants contained or referred to herein, TriMark Hockenbergs may, at its option, declare all of the obligations immediately due and payable and then shall have all of the remedies of a secured party under the Uniform Commercial Code of the state where the equipment is located. Such remedies shall include, but are not limited to, the right to take possession of the equipment. Expenses related to repossessing, holding, repairing, or reselling the equipment, including any collection costs, reasonable attorney's fees and legal expenses, shall be the responsibility of the buyer.

No warranty of merchantability or fitness for a particular purpose, or other warranty, express, implied or statutory, nor any affirmation of fact or promise is made by Seller with respect to the goods which are sold pursuant hereto.

TRIMARK HOCKENBERGS SHALL NOT BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL LOSSES, DAMAGES OR EXPENSES, DIRECTLY OR INDIRECTLY ARISING FROM THE SALE, HANDLING OR USE OF THE GOODS, OR FROM ANY OTHER CAUSE RELATING THERETO. TriMark Hockenbergs' liability hereunder and Buyer's exclusive remedy hereunder is expressly limited to the replacement (in the form originally shipped) of goods not complying with this Agreement or, at TriMark Hockenbergs' election, to credit Buyer with an amount equal to the purchase price of such goods, whether claims are for breach of warranty, negligence or otherwise. If you are in agreement with the aforementioned terms, prices, specifications and conditions, please sign a copy of this contract and return it to the undersigned at our offices, accompanied by any required advance payment.

Thank you for the opportunity to offer our quotation. We look forward to receiving your valued order.

Appendix G: Arena Seating and Sealant Proposals

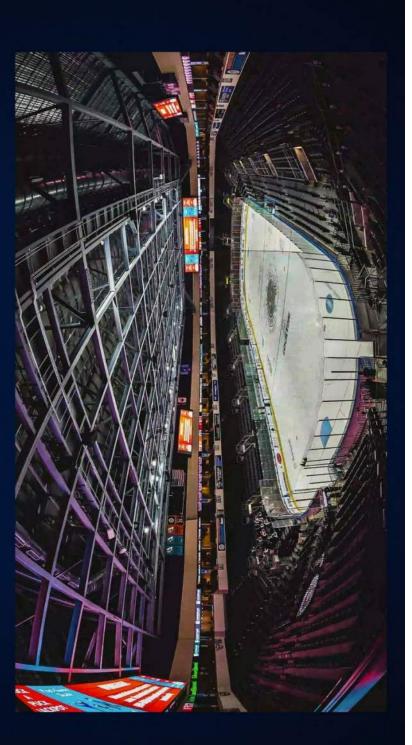

Proposal for Cable Dahmer Arena

Base Bid Cost

Description	Qty	Pricing
West End Zone MXP Telescopic Platform with Metro Seats	478	\$950,000
Add for Cupholders	478	\$6,000

Alternates for Consideration

Description	Qty	Pricing
Sidelines and East End Zone Maxam Plus Telescopic Platform with Metro Seats	1,132	\$1,200,000
Sidelines and East End Zone MXP Telescopic Platform with Metro Seats	1,132	\$1,650,000
Add Concrete Mounted Rails to West End Zone	16	\$14,771
Add End Curtains West End Zone	1	\$6,960
Add End Curtains for Sidelines & East End Zone	1	\$20,800
Add for Cupholders	1,132	\$14,206

Notes:

- Existing balcony rails behind platforms to be removed when platforms are in place to prevent interference.
- <u>Platform quote is based on a closed back dasher. An open back dasher may require an</u> altered design with added cost.
 - Vomitory through west endzone platform is designed to be 13'-0" wide x 15'-0" high.
- ADA platforms may need modification around the redesigned west endzone platform. Modifications will be done by others.
- <u>Alternate add for end guard rails are based on the standard Hussey Seating Company</u> rail design and attachment.
- <u>Alternate add for end guard rails based on concrete risers and treads having a depth of</u> 3" and 2", respectively, free and clear of reinforced steel (rebar) and wire mesh.
 - For alternate add with end guard rails the concrete treads must be a minimum of 4" thick and risers must be a minimum of 4 1/2" thick.
- Quote assumes concrete has a minimum compressive strength of 4000 psi for normal weight concrete and 5,000 psi for light weight concrete.

Notes:

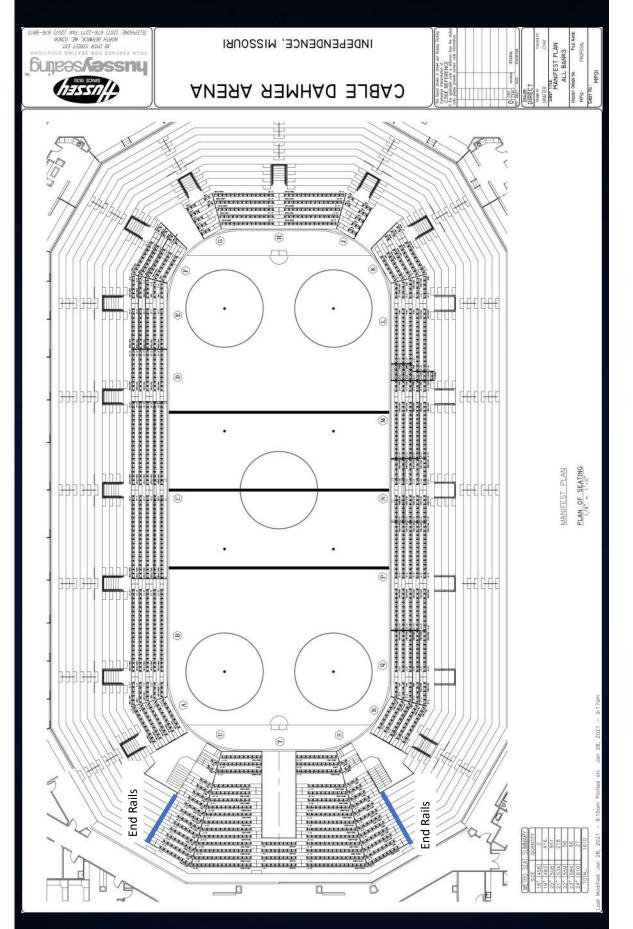

- Demolition and removal of existing platforms included in this price.
 - Taxes, Permitting and Bonds are not included in this price.
- Labor rates quote for on-site installation are open shop (non-union)
- Submittal drawings and seat manifest are included in the cost of our bid.
 - Does not include steps through dasher to ice cover.
- Front steps designed to egress down to concrete floor when dasher is removed.
 - Aisle lights are not included.
- Storage carts for end rails are included.
- Final cleaning after installation by others.
- Pricing is predicated on attached schedule. Any deviation (earlier or later) will require repricing due to steel market volatility.
 - Pricing assumes a 2022 purchase with a 2023 delivery

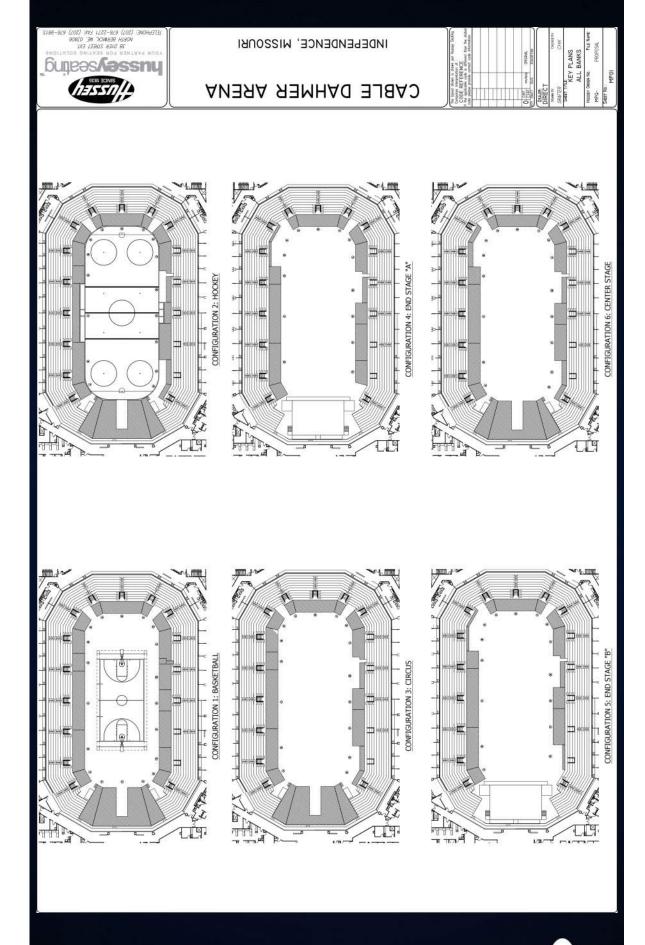

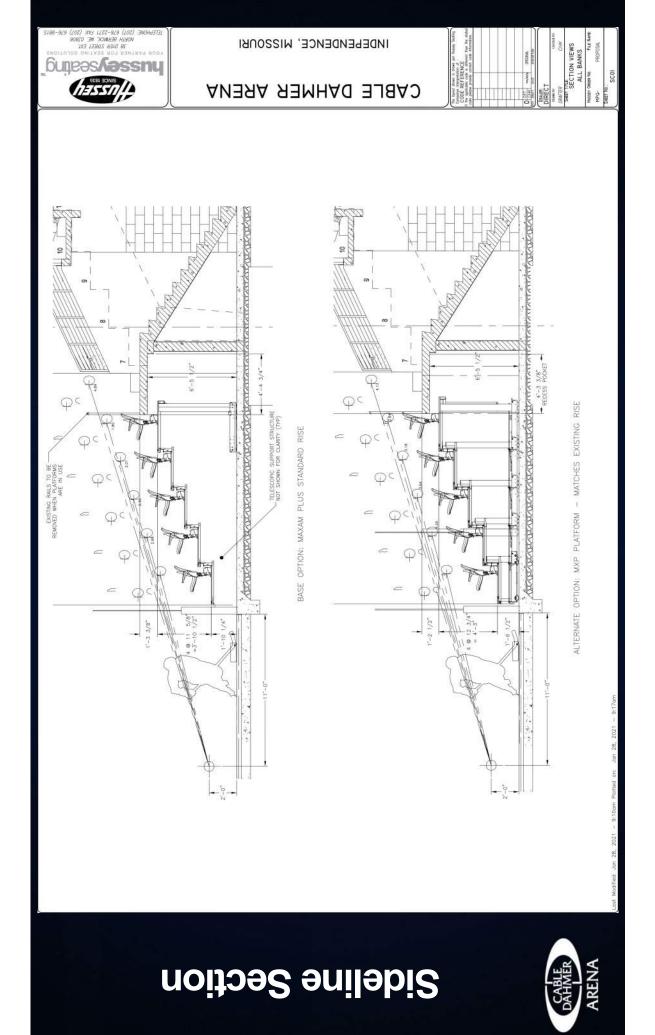

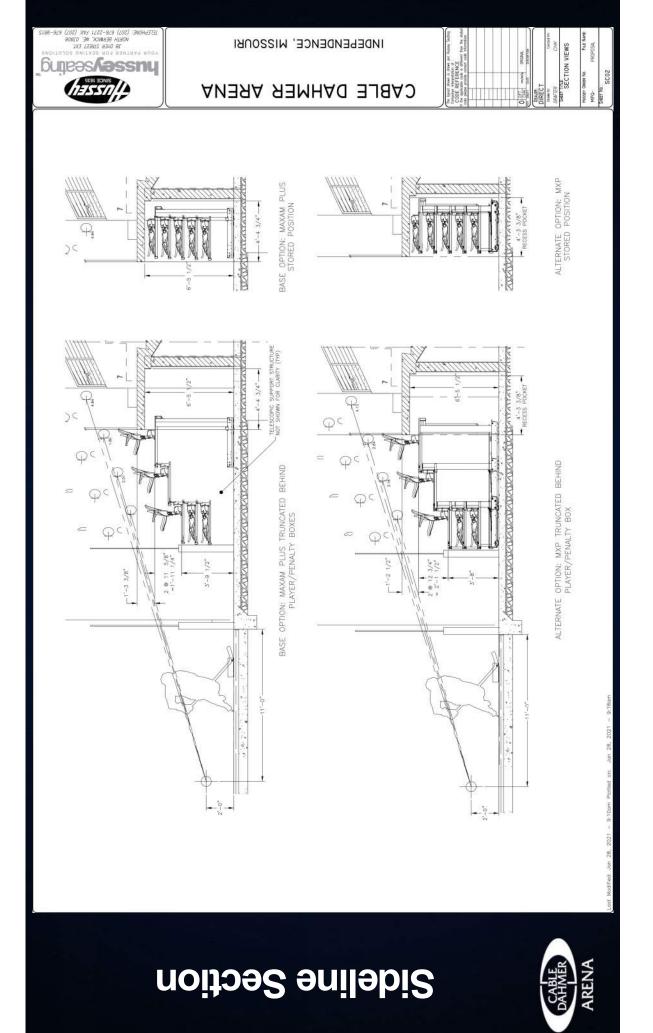

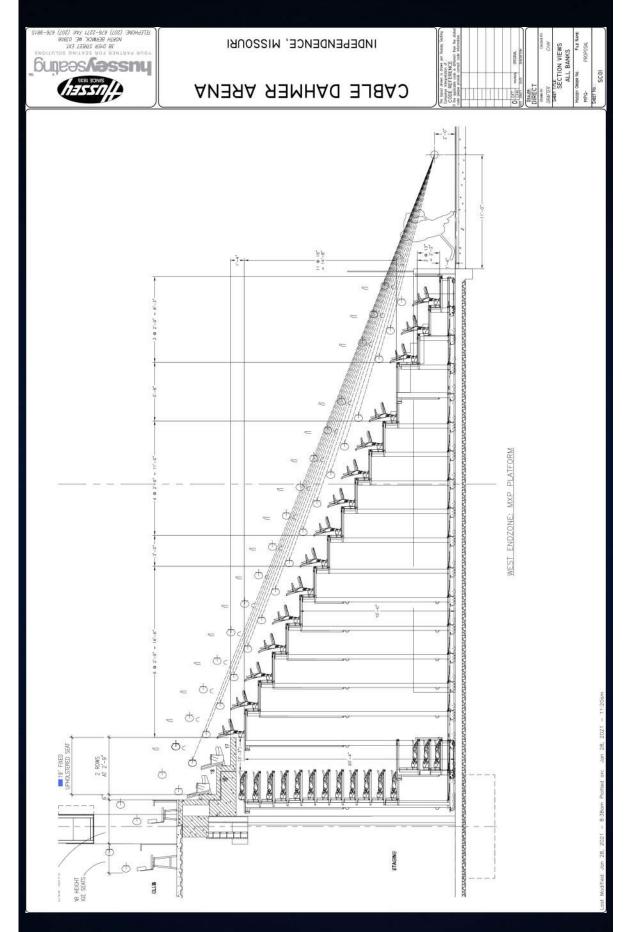

Arena Cofigurations

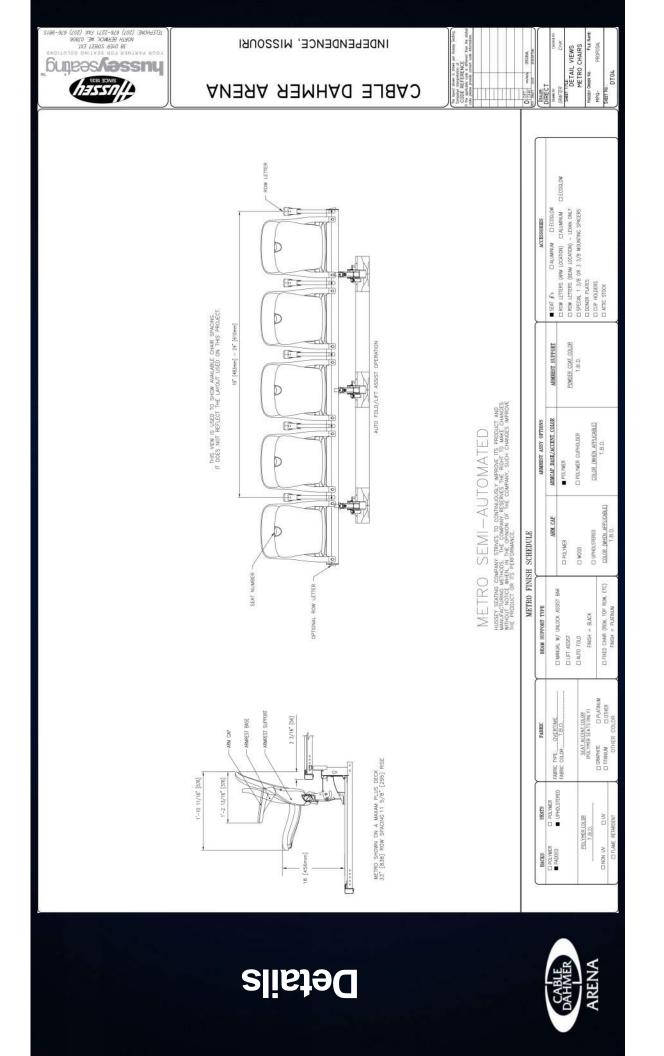

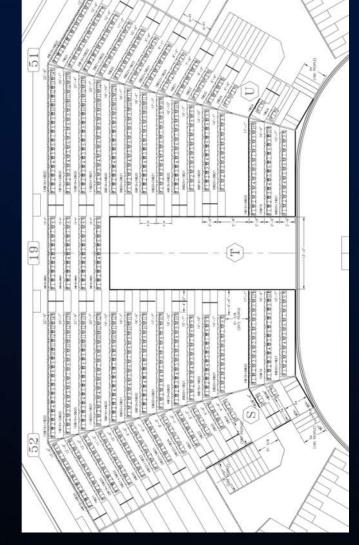

West End Zone Section

West End Zone Telescopic Platform

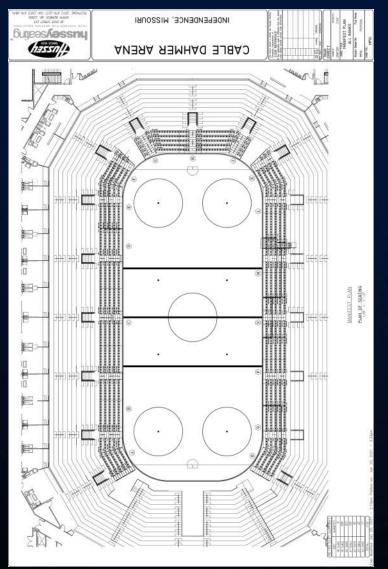

This is a Proprietary Design by Hussey Seating Company and Not To Be Shared Outside of Your Organization as We Have Many Engineering Hours Into Having This Design Meet Egress code

- Padded Seats and Backs with
- Semi-Automatic operation with gas strut Spradling Zander vinyl fabric lift assisted mechanism

MXP Telescopic Platform Highlights

- Expected 25+ Year Life Span with proper maintenance.
- improvements. Recent upgrades ideas came from facility operators to make both <u>MXP has been in continual use for 40 years and on its 6th generations of</u> setup and maintenance easier.
- Quick disconnect end rails only need a bolted connection on the top row. Eliminating 99% of bolted connections or clamps on each rail.
- We round all sharp corners on top and below the structure to keep both your fans and <u>operational staff safe.</u>
- We have the largest repair and maintenance staff in the industry to keep your equipment operational
- Larger wheel Diameter to distribute load over floor to reduce wheel marks.

ΥΠΟΙΟΙ ΕΕΑΤURES FOUND ON THE MXP

Allows 1 operator to adjust motor speed making it easier to steer large telescopic units into the right position. Other difficult to open and close the telescopic and OFF creating a jerking motion that manufacturers are turning motors ON A. Soft-Start Steerable Power platforms properly.

Fully captive upper and lower interlocks ensure the frames can never separate. Plus, the upper interlocks provide a stable, locked deck when loaded so your audience will feel safe. B. Fully Captive Interlocks

open / close. We use bolted connections in specific locations instead of welds to make future maintenance performance, the adjustable cantilevers Creating an exceptionally quiet deck and better overall operational eliminate friction points during C. Adjustable Cantilevers and repairs easy

braces provide a safe, rigid walking surface. Vertical tube columns are 6" thick for addition rigidity and D. Tubular Knee Bracing loads, the tubular knee Designed to withstand heavy use and heavy strength

nests completely, permitting a zero-Wheels The lower interlock design offset between tiers that minimizes E. Lower Captive Interlocks and Pre-tension guide rods cannot be disengaged resulting in smooth, reliable operation. **6" diameter** wheels make the operation of the the closed footprint of the system. MXP easier to open and close.

the walking surface creating an improved "coefficient of slip resistance" factor to reduce slip and fall accidents. Our 1" 1" thick aluminum deck walking the aluminum perpendicular to surface with the serrations in surface is also an option to plywood with a Polyvinyl educe cost.

5 Year ***** Warranty

Our warranty is on structure, parts, freight and labor for a full 5

Metro Semi-Automatic Seating

years.

Estimated 25+ year life cycle of Telescopic Platform with proper maintenance.

P ----

Gallery 3

Our quick connect/disconnect end rails only need one bolted connect on the top row vs bolt or clamping rails on each row.

Custom Rise and run heights and depths available.

 Increased ease of portability when needed to move in and out of storage with a built in intergral hydraulic dollie system.

SEATING OPTIONS

0

A. Posi-LockTM LX

These automatic row locks prevent accidental closure when the system is in use. This patented, innovative, low-profile design minimizes the chance of accidental damage, ensuring consistent operation.

B. Nose & Riser Beam

These rolled form structural members provide continuous deck support, and are through-bolted to the frame and stabilizers. These designs deliver unparalleled strength, durability and rigidity.

C. Continuous Positive Interglide

This interlocking glide system is a rigid, one-piece formed design which tracks better and operates easier than systems with 1/2" (13 mm) row to row engagement. The 10" (254 mm) minimum interlock provides the industry's most rigid, stable design. Our wheels are 5" (127 mm), resulting in less rolling friction.

D. Captive Interlock & Adjustable Row Stops

The Captive Interlock System engages and aligns deck to deck. In addition, MAXAM[®] can be configured for three different row-spacing setups—adjustable on-site if required. MAXAM incorporates three stabilizer assemblies per section to provide improved tracking and stability

E. Independently Locking Flex-RowTM

Each Flex-Row is equipped with an independent self-locking mechanism to deliver maximum flexibility, performance and safety.

F. Full-Length Captured Decking

Decking is captive in the riser beam and rests on the nose, firmly secured by the seat bracket. This system provides a stiff, secure walking surface with no exposed hardware. MAXAM is the only telescopic gym seat that utilizes transverse decking, using decking materials in accordance with their industry span rating. Thoroughly load tested and independently verified, MAXAM's continuous full-length deck support system provides an enhanced level of performance, safety and stability.

G. Slant Frame Design

Load-tested and certified for 30 tier single stack sections up to 25' 6" (7772 mm), our slant frame design delivers improved cantilever strength and capacity. It also simplifies the installation process, reducing downtime for the facility. Critical support areas are all fastened with bolts, lock washers and hex nuts. Only MAXAM incorporates a steel to steel connection where the frame meets the wall, creating a stronger union and a safer gym seat.

H. Tension Bracing

Through bolted to the frame to provide additional stability. All bracing is coined to remove sharp edges, and all ends are rounded for safety.

Comfortable Telescopic Platforms are no longer a dream, courtesy of the wide variety of seating solutions that both our MAXAM+¹^M and MXP Telescopics can support. Sleek, slim and easy to install, the MetroTM line is a giant leap towards getting the most out of your facility. Available in both telescopic and fixed versions, Metro allows perfect continuity throughout a facility. Metro features whisper-quiet seat operation and fits in an amazingly tiny 6 ½ (165 mm) stored envelope.

Metro seats easily fit into both new and existing facility dimensions. The beam-based system allows easy adjustment and makes future maintenance, chair replacement and upgrading a breeze. Composite finishes from all polymer to fully padded seats provide patrons with a singularly comfortable game time experience with this ergonomically designed seat. Gas strut lift assist mechanisms and the ability to quickly adjust the seat to limit movement make this seat a fan of the facilities operations staff.

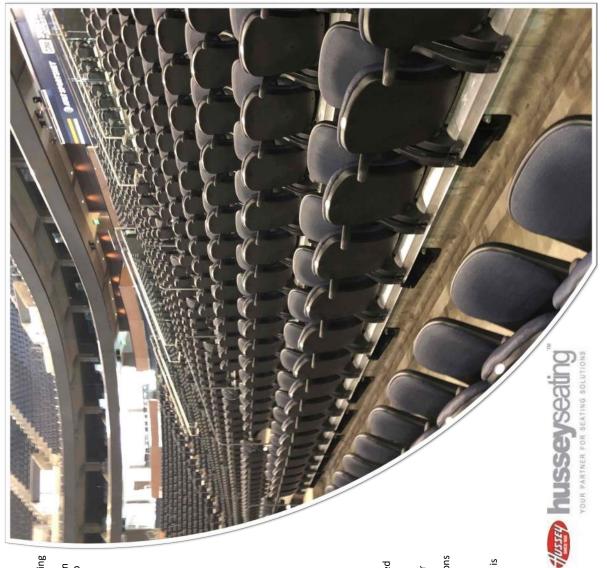

IMPROVE YOUR FAN EXPERIENCE WITH METRO SEAT

- The Metro seats incorporate both comfort and style. The entire seat is molded using advanced engineering polymers, and is available in 18", 19", 20", 21" & 22" standard widths (or any variation in-between).
- Metro has a full line of arm options including polymer, upholstered and wood, as well as cup holders, and many other accessories.
- Metro chairs are available with polymer-finish seats and backs, or upholstered back pads and seats. They're also available in a fully enveloped seat Equipped with our folding tablet arm. Combinations of back and seat styles are also available to allow further differentiation of seating sections.
- Metro may be deployed with or without arms and the seat width is easily varied for ideal seating layouts or to maximize capacity.
- Metro is available with a choice of either semi automated (2-14 chairs) or manual (1-4 chairs) fold-down mechanisms.
- Available in both standard and customer colors.
